

How to Keep Using Your Computer While Showing a Movie on the Projector Screen

To use your computer while showing a movie, presentation, etc. at the same time, hold down the “windows button” on your keyboard and the letter “p” to bring up the projector menu.

Next, select the “Extend” option from the menu and drag the window containing the file, movie, etc. to the screen shown on the projector; on the projector screen you will now see a duplicate of your desktop background image but your start menu and icons will not appear.

Now you will have to drag the window from your desktop screen to the right until it shows up on the projector display. (Please note: In order to move the window over, you must first hit the “restore down” button in the file window next to the red “X” (this button looks like two nested squares and reduces the window from full screen to one that you can drag around).

Once the window you are using shows up on the projector display, you may click the “full screen” icon next to the red “X” and continue working from your desktop display while your students watch the projector screen.
